TabBridge in 6 steps

Let your AI agent use your own Chrome, with your sign-ins, and see every step it takes.

Works with Claude Code, Codex, Gemini CLI, Cursor, or any agent that speaks MCP.

STEP 1

Install the bridge

Once per computer. You need Node.js 20 or newer.

```
npm install -g @verbodhpteltd/tabbridge  
tabbridge install
```

The second line registers the small helper Chrome talks to. Nothing runs until the extension starts it.

STEP 2

Add the extension to Chrome

1. Download **tabbridge-extension-0.2.2.zip** from the latest release on GitHub, and unzip it.
2. Open **chrome://extensions** and turn on Developer mode.
3. Click **Load unpacked** and pick the unzipped folder.

Works in Chrome, Edge or Brave, on Windows or a Mac.

STEP 3

Connect your agent

```
# Claude Code
claude mcp add tabbridge -- tabbridge mcp

# Codex, Gemini CLI or Cursor
tabbridge config codex

# Check every part
tabbridge doctor
```

Doctor shows a ✓ or ✗ for each part, and what to do about each ✗.

STEP 4

Ask, then watch every step

Open the live console in Chrome's side panel. Each step shows as it happens. What you type is never shown.

STEP 5

Choose: ask first, or YOLO

YOLO mode is on at first. Switch it off and TabBridge asks next to its icon before anything risky: send, buy, delete, publish.

STEP 6

Send your agent a note, or the page

Type a note in the side panel. Press + to send the page you're on too. Then tell your agent to check what you sent.

Free on GitHub

github.com/verbodh-pte-ltd/tabbridge

Your agent only uses its own tabs. Cookie values and tokens stay hidden unless you allow them.

Want an agent like this around your own tools?
VerBodh builds secure MCP servers and AI agents.
